Updating Windows Live Mail for POP3 Connections

VERSION 1.0
Configuring Windows Live Mail for POP3 Connections Overview

Windows Live Mail is a free email client that comes built into Windows Vista and Windows 7. Like most emails clients, Windows Live Mail offers several methods to connect to an email account. While we highly recommend that all users choose an email client that supports Exchange, this may not always be possible. If you use Windows Live Mail, IMAP is the preferred method of connecting to your UAConnect account as this email client does not support Exchange connections. Be aware that using IMAP to connect to your email account will only give you access to your email; an IMAP connection will not allow you to view your UAConnect Calendar.

Be aware that using POP3 to connect to your email account will only give you access to your email; a POP3 connection will not allow you to view your UAConnect calendar. In addition, there can be other issues when using POP3. There is a risk of locking the mail box if you access it too often via POP3. In this case, the mail box is unavailable for a certain period of time. There is also a risk of misconfiguring the account, so that all of your emails are downloaded to a single computer. This will make it impossible to see those emails via OWA or on another device.

Step 1: Update an email account in Windows Live Mail

- Right click on your account on the left window. Then choose Properties.
- Click on the **Servers** tab and ensure all of the information is the same.

- Now click on **Advanced**. This is where you can update the Outgoing Server port to **587**
